MyAIAgent Stock Bot — FAQ

Q: What does RSI mean?

RSI stands for Relative Strength Index. It measures how overbought or oversold a stock is on a scale of 0 to 100. Below 30 means oversold. Above 70 means overbought.

Q: Why is the 300% rule used?

Backtesting showed that stocks with more than 300% buy-and-hold return over 10 years are in strong uptrends. RSI signals failed 0 out of 22 times on these stocks, so they are excluded.

Q: What is paper trading?

Paper trading means simulating trades with virtual money. No real money is at risk. It is used to validate whether the RSI strategy works before committing real capital.

Q: When do I exit a trade?

Exit when the RSI of the stock rises above 60. This is the target exit RSI set in the trade rules.

Q: What sectors are allowed?

All sectors except Airlines. The Airlines sector was tested and rejected during backtesting.

Q: How often should I check the screener?

Once per day is enough. The daily status task runs automatically each morning and saves the latest RSI readings.

Q: Can I change the thresholds during validation?

No. All thresholds are frozen until 20 to 30 trades are closed. Changing rules mid-trial would invalidate the results.
